To whom it may concern:

Established in 1955 by Salvatore Cafiero in Naples, Italy, the Augustea Group is a provider of sea transportation services, which mainly operates in the following business segments:

- dry bulk shipping
- deep sea towing services
- transportation with oceanic barges

For the transportation with oceanic barges the load-ins and load-outs of cargo on the barges is a very important part of the operation. During this operation the monitoring of the Roll & Pitch angles are crucial for the correct ballast procedures. As the manual monitoring of these angles is very time consuming and requires dedicated personal an automatic system could improve the project in time and reliability.

With the MOSS system of TARKA-SYSTEMS we found a system which covers all of the following aspects:

- Portable system, easy to install on any barge
- Battery powered and quick setup time
- Presentation and storage of Roll & Pitch values
- Additional option for draft sensor for integrated draft measurement

The MOSS system has been applied at multiple projects all around the world and the system improves our setup, safety and reliability for these projects. Additional to that the data is also stored for further analyzing, if required.

The in-house knowledge of TARKA-SYSTEMS is based on the owner, Henry Wijgerse. With over 15 years personal on-site experience with the assembly and installation of sensors and monitoring systems, the cooperation with TARKA-SYSTEMS is very professional.

We highly recommend TARKA-SYSTEMS to you for any marine projects involving sensors and monitoring systems.
